

1                   **ABSTRACT OF THE DISCLOSURE**

2                  The present invention provides a scanner including a housing  
3                  defining two mounting holes. An elastic rib is located beside each of the two  
4                  mounting holes to provide a retaining action. A paper cover is pivotally  
5                  mounted on the housing and has two locking hooks. Each locking hook is  
6                  mounted in a respective mounting hole of the housing. Thus, the height of the  
7                  paper cover can be adjusted according to the variation of depth of the locking  
8                  hook in the mounting hole. In addition, the locking hook is retained by the  
9                  elastic rib and the catch plate of the mounting hole, such that the paper cover  
10                 cannot be removed easily, thereby preventing the paper cover from being lost.
